## Objectives

**Following this lecture, the participant will be able to:**

1. Identify which patients are at risk for RBC and platelet alloimmunization through screening processes
2. Discuss and use prevention strategies for Rh disease
3. Recognize when workup for NAIT should be performed.
4. Discuss referral and management (including delivery timing) approaches for RBC and platelet alloimmunization.
5. Discuss the implications for future pregnancies.

---

---

---

---

---

---

---

---

4

## Alloimmune Diseases in Pregnancy

- Similar to graft-vs-host reaction
  - “Mother develops an Ab directed against a fetal Ag that crosses the placental barrier to cause fetal disease.”
- Alloimmune conditions in pregnancy:
  - RBC: Hemolytic disease of the Fetus and Newborn (HDFN)
    - In U.S.: 1-2% pregnancies (10-15% women are Rh-)
  - Plt: Fetal Neonatal Alloimmune thrombocytopenia (FNAIT)
    - 0.1-0.3% incidence in pregnancy
  - Liver: Gestational Alloimmune Liver Disease (GALD)
    - 4/10,000 live births

---

---

---

---

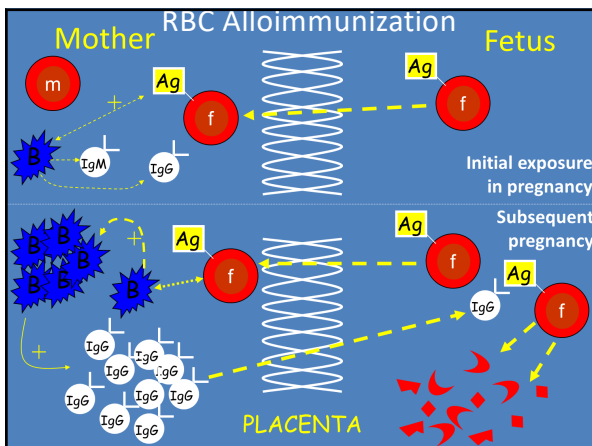

---

---

<b>Red Cell Alloimmunization</b>
<ul style="list-style-type: none"><li>• &gt;400 red cell antigens</li><li>• Mother Lacks Ag → Produce Ab</li><li>• Maybe harmful to the fetus <u>or</u> patient given a blood tx</li><li>• Isoimmunization uncommon. Why?<ul style="list-style-type: none"><li>– variable antigenicity</li><li>– maternal immune response to Ag is variable</li><li>– insufficient transplacental passage of Ag or Ab</li><li>– protection by ABO incompatibility</li></ul></li></ul>

8

---

---

---

---

---

---

---

---

<b>ABO Incompatibility</b>
<ul style="list-style-type: none"><li>• Most common cause of HDN</li><li>• 20% of all infants<ul style="list-style-type: none"><li>– 5% are clinically affected</li><li>– Mild disease<ul style="list-style-type: none"><li>• Neonatal Jaundice or anemia</li><li>• No erythroblastosis fetalis</li></ul></li><li>– Affects future offspring – “not progressive”</li></ul></li></ul>

9

---

---

---

---

---

---

---

---

### ABO Incompatibility

*Why no concern antenatally?*

- Milder than D-isoimmunization
- IgM isoantibodies- don't cross the placenta
- Fewer A and B Ag sites on fetal RBCs
- Offers some protection against D isoimm.
  - Fetal RBCs that cross - rapidly destroyed

Bottomline....

- Pediatric concern – not an OB concern

---

---

---

---

---

---

---

---

10

### Rh Alloimmunization in Pregnancy

**How common is it?**

- In U.S.: 15% incidence of Rh- status; varies by race & ethnicity:
- Rh negative status:
 

– Whites 15%	• Basques – 30 to 35 percent
– African Americans 5-8%	• White North Americans or Europeans – 15 percent
– Asians & Native American 1-2%	• Black or African Americans – 8 percent
	• Africans – 4 to 6 percent
	• Indians – 5 percent
	• Native Americans and Inuit people – 1 to 2 percent
	• Japanese – 0.5 percent
	• Thais – 0.3 percent
	• Chinese – 0.3 percent
- Among whites:
  - Rh- woman has an 85% chance of reproducing with a Rh + male
  - 60% are heterozygous and 40% are homozygous at the D locus

Zipursky & Paul, Global burden of Rh Dz, 2011

---

---

---

---

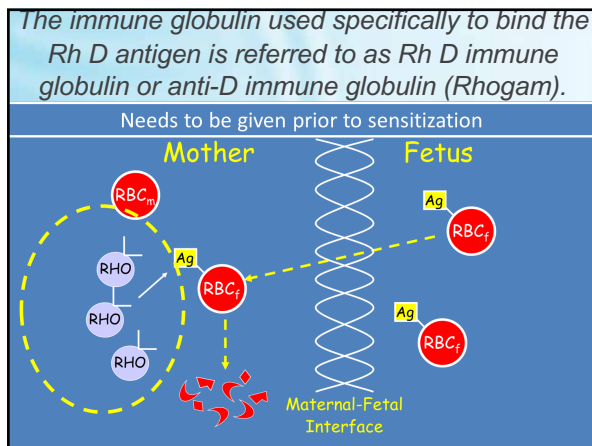

---

---

11

---

---

---

---

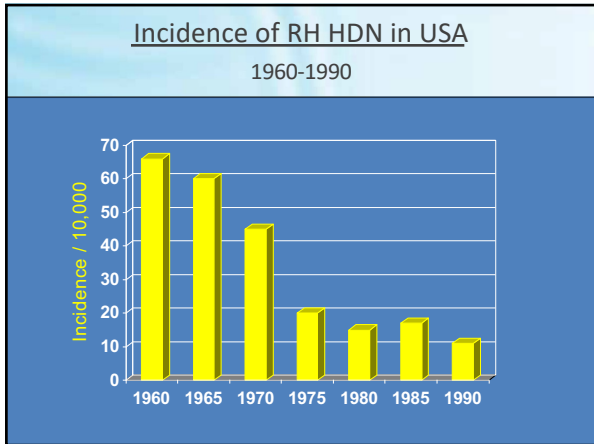

---

---

---

---

12

13

---

---

---

---

---

---

---

---

- Alloimmunization from “irregular or atypical” (e.g. non-Rh ) antigens *cannot* be prevented by prophylactic administration of immune globulin

Leads to isoimmunization by other multiple antibodies

14

---

---

---

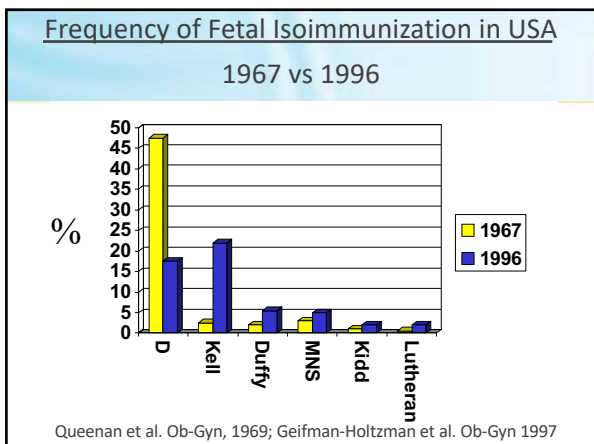

---

---

---

---

---

15

---

---

---

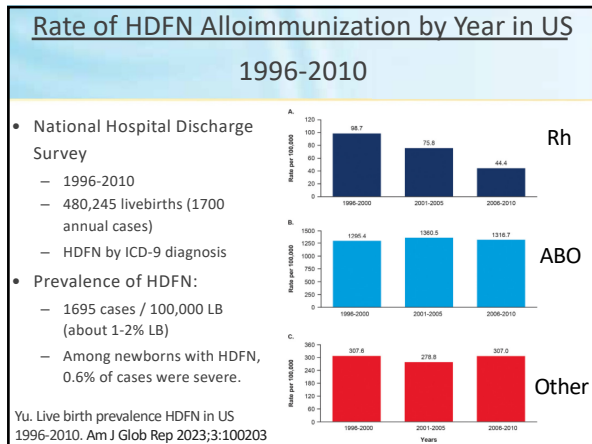

---

18

**Screening for RBC Alloimmunization**  
*ACOG & Am Assoc of Blood Banks*

All pregnant women, at first prenatal visit of each pregnancy should be tested for...

**ABO blood group, RH-D type & RBC Ab screen (ABS)**

- Repeat ABS before Rhogam administration:
  - 28 weeks
  - Postpartum
  - At time of any event...

*ACOG PB 192, 2018*

---

---

---

---

---

---

---

---

19

**Volume of M-F hemorrhage leading to Rh D alloimmunization can be as small as 0.1ml**

Box 1. Potential Sensitizing Events in Rh D-Negative Women in Pregnancy	M-F Hemorrhage Risk
Chorionic villus sampling, amniocentesis, cordocentesis	CVS: 14%; Amnio: 2-6%
Threatened miscarriage or miscarriage	1 <sup>st</sup> trimester: 3-11%
Ectopic pregnancy	ruptured: 24%
Evacuation of molar pregnancy	
Therapeutic termination of pregnancy	< 8 wks: 3-11%
Antepartum hemorrhage	
Abdominal trauma	up to 40%
Intrauterine fetal death	
External cephalic version	2-6%
Delivery	3rd trimester: 45%

*ACOG PB 181, 2017*

---

---

---

---

---

---

---

---

20

**Management of Alloimmunization**

---

---

---

---

---

---

---

---

21

Once RBC Alloimmunization is established (positive maternal ABS)...

↓

Determine if fetus is at risk

- FOR Non-RH+ ABS...Determine FOC Ag status / NIPT
- FOR RH+ ABS...Determine FOC Rh status (Ag status)
  - FOC Rh Negative → done—no further testing (Paternity?)
  - FOC Rh Positive → Zygosity Testing
    - homozygous (40%) → No further FOC testing (all fetuses Rh+)
    - heterozygous (60%) → **fetal** genotyping (cf fDNA over amnio)

↓

---

---

---

---

---

---

---

---

22

If FOC Rh homozygous OR carries the non-Rh RBC Ag OR if unknown paternal status, OR Ag+ fetus by cf fDNA or amnio

↓

Serial antibody titers

---

---

---

---

---

---

---

---

23

Serial Ab Screens

- Serial Ab titers until a “Critical Threshold Titer” is reached (monthly, q 2 wks if rising).
  - Critical titer varies by hospital
    - Typically: 1:16 or 1:32 (most are 1:16)
    - Check with your hospital blood bank
  - Exception is anti-Kell Ab which is 1:8

---

---

---

---

---

---

---

---

24

### Critical Threshold Ab Screens

- Once met → Evaluate for fetal anemia.
- MCA PSV Doppler replaced  $\Delta OD450$
- Fetal anemia  $\downarrow$ s blood viscosity  $\rightarrow \uparrow$ s velocity

#### PW Doppler of MCA Circle of Willis

25

---

---

---

---

---

---

---

---

### MCA Doppler Predicts Fetal Anemia

- $>1.50$  MoM MCA peak velocity for the detection of moderate/severe anemia
  - Sensitivity: 100%
  - False positive: 12%
  - Positive predictive rate: 65%
  - Negative predictive rate: 100%

Mari et al. NEJM 2000;342:9-14

26

---

---

---

---

---

---

---

---

### Fetal Blood Sampling & Transfusion

27

---

---

---

---

---

---

---

---

**RBC Alloimmunization**  
*Delivery Timing*

- Controversial
- Sensitized but critical titer not reached: 39w
- Mild disease (critical titer reached; normal MCA): 38-39w
- Moderate-Severe disease (e.g. IUTs):
  - 32-34w (historically)
  - If last transfusion 35-36w, delivery 37-38w
  - Phenobarbital 30mg/d 1 week prior to delivery (?)

---

---

---

---

---

---

---

---

28

**RBC Alloimmunization**  
*Next Pregnancy*

- Prior IUT, hydrops, HDFN PTB or NN exchange tx can expect development of severe fetal anemia if next fetus is Ag+ for offending Ab (e.g. FOC status: repeat zygosity testing. Same FOC?)
- Determine fetal Ag status early & begin MCA PSV at 16-18 weeks.
- Increasingly severe HDFN
- *Coming Soon:* mAb against IgG

---

---

---

---

---

---

---

---

29

**RBC Alloimmunization**  
*Next Pregnancy*

- Nipocalamib treatment for severe HDFN
  - mAb blocks placental transfer of IgG and lowers maternal titers (FcRn receptor blockade)
- Phase II trial completed
  - 50% pts w prior early onset severe HDFN did not receive IUTs until after 32w.
- Phase III / RCT starting. Entry criteria:
  - Alloimmunization to D, c, E, Kell, Jka
  - Critical titer & positive cf fDNA for Ag at screening
  - 1 or more previous transfusions in prior pregnancy
  - <15w in current pregnancy
- Several U.S. fetal treatment centers participating
  - Study visits, travel & infusions covered.

## Fetal & Neonatal Alloimmune Thrombocytopenia (FNAIT)

34

---

---

---

---

---

---

---

---

### FNAIT

- Fetal-Neonatal alloimmune thrombocytopenia (TCP) is the *platelet equivalent* of hemolytic disease of the fetus and newborn.
- Develops as a result of maternal alloimmunization to fetal platelet antigens with transplacental transfer of platelet specific antibody and subsequent platelet destruction.
- 15 plt specific antigens described. Most severe cases due to sensitization to HPA 1a
- Affects 1 in 1000-3000 live births

ACOG PB 207, 2019  
Williamson et al. Blood, 1998

35

---

---

---

---

---

---

---

---

### FNAIT: Management & Outcome of a Large International Retrospective Cohort (2017)

HPA type	Cases, n (%)	Mean PC $\times 10^9/l$	ICH, n
HPA-1a	544 (88)	105	19
HPA-5b	23 (3.6)	136	2
HPA-3a	7 (1.1)	147	
HPA-5a	4 (0.6)	184	
HPA-15a	5 (0.8)	200	
HPA-1a + -5b	18 (3)	94	2
HPA-1a + other	5 (0.8)		
Negative	2 (0.03)		
Unknown	7 (1.1)		
<b>Total</b>	<b>615</b>		

PC = Platelet count.

### Causes of Maternal TCP in Pregnancy

*Maternal TCP & Fetal TCP Risk*

Box 1. Causes of Thrombocytopenia in Pregnancy	Neonatal Thrombocytopenia Risk
Gestational thrombocytopenia	Low: 0.1-2.3%
Hypertension in pregnancy	Low: 0.0-1.8%
Preeclampsia	
HELLP syndrome	
Primary immune thrombocytopenia	• ITP
Secondary immune thrombocytopenia	— plt <150k, 25% risk (not severe)
Antiphospholipid syndrome	— No correlation b/w maternal & fetal plt counts
Systemic lupus erythematosus	— Although 8-15% newborns will be treated for TCP, severe complications are rare (<<1%)
Infectious (such as HIV, hepatitis C virus, cytomegalovirus, <i>Helicobacter pylori</i> )	
Drug-induced thrombocytopenia (use of drugs such as heparins, antimicrobials, anticonvulsants, analgesic agents)	
Association with systemic conditions	
Disseminated intravascular coagulation	
Thrombotic thrombocytopenia/hemolytic uremic syndrome	
Splenic sequestration	
Bone marrow disorders	
Nutritional deficiencies	
Congenital thrombocytopenia	

Abbreviations: HELLP, hemolysis, elevated liver enzymes, and low platelet count; HIV, human immunodeficiency virus

ACOG PB 207, 2019

37

---

---

---

---

---

---

---

---

---

---

### FNAIT

*General Features*

- Uncomplicated pregnancy & maternal plt cts are normal
- 25% FNAIT occur in the first pregnancy
- Leading cause of severe TCP in fetus & neonate
- Majority of NAIT mild (petechiae, bruising or TCP on CBC)
- Leading cause of intracranial hemorrhage (ICH) in term NN
- 15% of infants with plt cts <50 x 10<sup>9</sup>/L have an ICH
- ICH: 80% occur antenatally and ½ can be seen prenatally
- High recurrence risk (upwards of 100%) if subsequent sibling carries the offending plt antigen

ACOG PB 207, 2019; Peterson et al. Br J Haematol 2013;161:3  
Kovanlikaya et al. Pediatr Blood Cancer 2017

38

---

---

---

---

---

---

---

---

---

---

### FNAIT

*Screening & Diagnosis*

- Screening
  - No blood screening test
  - History of an affected child
    - Unexpected thrombocytopenia
    - History of ICH
  - Direct relation to such a woman
  - Incidentally found to lack HPA-1a

Thus, reliant on the screening history at OB intake.

- Diagnosis: laboratory workup
  - Experienced reference laboratory
  - Flow cytometry: rapid method of detecting plt reactive Abs
  - Screen for Class I HLA Ab and for the specific glycoprotein the maternal Ab is targeting.

39

---

---

---

---

---

---

---

---

---

---

**FNAIT**  
*Antenatal Imaging*

Prenatal Ultrasound

- ICH (acute vs chronic)
- Ventriculomegaly
- Porencephalic cysts
- ICH documented as early as 14 weeks

MRI

- T1 weighted images to identify blood
- May detect hemorrhage not seen on US
- Maybe useful in identifying old vs new hemorrhage

**FNAIT Management**

Primary goal in OB mgmt of FNAIT: ICH prevention  
Optimal treatment remains uncertain.

- Patients stratified based on + or – ICH and GA at manifestation of ICH in sibling(< or >28 weeks)...1996 RCT & 2017 MA
  - Several therapies & dosing strategies
    - Maternal IVIG at 12wks: 1mg/kg for ICH <28w; 2mg/kg if ICH >28w
      - At 20 wks dosing doubled; Prednisone added
    - No plt sampling for therapy monitoring (11% exsanguination risk).
  - None of these were effective in all cases in the RCT
    - IVIG generally improved fetal plt ct by 68K by delivery
    - 0/55 ICH w IVIgG (10 in sibs)
    - Platelet transfusions increase plt ct, but short ½-life & high IUFD complication rate in other studies (11%)

**Weekly Platelet Transfusions for AIT**

Week	Platelet Count (x 10 <sup>9</sup> /l)
25	50
26	20
27	210
28	30
29	220
30	40
31	230
32	50
33	80

### FNAIT Management

- Historically, FBS included in FNAIT management to assess effectiveness of therapy
  - Prospective therapeutic studies – FBS not needed.
- IVIG w or w/o corticosteroids equally effective vs IUT platelet transfusion in raising plts w/o exsang risk.
- Consensus guidelines:
  - early empiric initiation of IVIG +/-steroids based on risk stratification.
  - FBS reserved for >32 wks to assess tx effect IF, SVD desired
  - CS at 37 weeks recommended.

Comparison of Anti-D HDFN & FNAIT		
Factors that Differ	FNAIT caused by anti HPA-1a	HDFN caused by anti-D
At-Risk Pregnancies	~2% of women HPA-1a-negative; <1% also DRRB3*0101 positive	Approximately 10% of women (D-)
Occurrence of disease	First pregnancy, commonly	2 <sup>nd</sup> & subsequent pregnancies (commonly anti-D)
Ab response after incompatible transfusion	Anti-HPA-1a is rarely formed	Anti-D is most frequent
Effect of alloantibodies	Thrombocytopenia	Anemia, hemolysis
Causes of fetal death	Intracranial hemorrhage	Heart failure, hydrops
Causes of neonatal death	Intracranial hemorrhage	Kernicterus/bilirub encephalopathy
HLA association with Ab response	>90% HLA DRB3*0101; >90% HLA DOB1*0201	Weak or no association
Routine screening	None	First prenatal visit; D phenotype
Antibody detection	Postnatally; usually after birth of baby with thrombocytopenia	1 <sup>st</sup> & 3 <sup>rd</sup> trimester by screening
Ab concentration in preg	Some correlation w TCP severity	Good correlation w anemia severity
Postnatal antibody	Remains for years	Declines after months
Noninvasive fetal dx	None	Doppler of MCA for fetal anemia
Tx to pregnant woman	IVIG ± steroids; dose/duration based on prior history	None; IVIG now for early disease
Tx of babies in severe cases	Fetal IUT & Neonatal transfusion	Fetal IUT, NN exchange Tx, phototx
Immunization prevention	None	Ante & post-natal RhIG

## Key Points & Clinical Pearls

---

---

---

---

---

---

---

---

---

---

48

**HDFN**  
*Clinical Pearls*

1. The major cause of HDF is D and Kell sensitization, not ABO incompatibility.
2. Ab titers remain the mainstay for screening & detection of sensitized mothers.
3. Know the critical titer at your hospital (1:16 or 1:32).
4. Kell does not act like other RBC antigens and requires a lower threshold for FBS (1:8).
5. Ultrasound is useful for establishing dates, evaluating for hydrops, HSM, MCA PSV and for transfusions.
6. MCA peak systolic velocity has replaced amnio and serial  $\Delta$ OD 450 testing for fetal anemia.

49

---

---

---

---

---

---

---

---

**FNAIT**  
*Clinical Pearls*

- Screening **focus**: OB history & Newborn outcomes at initial PNV
- Suspect FNAIT: Unexplained fetal/NN TCP, hemorrhage or ICH
- What tests should be ordered?
  - HPA type & zygosity of both parents; confirm incompatible
  - Use an experienced regional reference laboratory
  - Plt typing helpful when FOC is heterozygous; can be done from amnio or from cf fDNA testing.
- Primary goal in OB management of FNAIT: ICH prevention
- Early detailed anatomic survey by ultrasound & serial ultrasound evaluations
- Early referral to MFM for IgG  $\pm$  steroid therapy
